Abstract

A method is presented in which matrix elements for some processes are calculated recursively. This recursive calculational technique based on the method of basis spinor, which related with isotropic tetrad in Minkowski space.

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams ”
The main approach, which has gained popularity in the past decades, is to calculate the Feynman amplitudes directly. Many different methods of calculating the reaction amplitudes with fermions have been developed.

**Victor Andreev**, “Recursive technique for evaluation of Feynman diagrams”
In the general these methods of Feynman amplitudes calculation can be divided in three groups (see Fig.1).

[1]- Trace methods:

A.A. Bogush, F.I. Fedorov, Vesti AN BSSR, ser.fiz.-m.n. N 2, 26 (1962).

A.A. Bogush, Vesti AN BSSR, ser.fiz.-m.n., N 2, 29 (1964).

[2]- Spinor Technique:
F.A. Berends, P.H. Daverveldt, and R. Kleiss, Nucl. Phys. B253, 441 (1985);

In this method the matrix element is reduced to spinor products of Dirac spinors, i.e. \( \bar{u}_{\lambda_p} (p, s_p) u_{\lambda_k} (k, s_k) \). The spinor products are calculated through momentum components by means of traces.

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams”
Nontrace and Non Spinor Techniques: In these methods the algorithms of reduction of a matrix element to the scalar form differ from the above mentioned methods. A. Ballestrero and E. Maina, Phys. Lett. B350, 225 (1995)

It should be noted that there are methods of calculating cross sections without the Feynman diagrams

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams ”
Let us introduce the orthonormal four-vector basis in Minkowski space which satisfies the relations:

\[ l_0^\mu \cdot l_0^\nu - l_1^\mu \cdot l_1^\nu - l_2^\mu \cdot l_2^\nu - l_3^\mu \cdot l_3^\nu = g^{\mu \nu}, \quad (l_A \cdot l_B) = g_{AB}, \]  

(1)

where \( g \) is the Lorentz metric tensor.

With the help of the vectors \( l_A (A = 0, 1, 2, 3) \) we can define lightlike vectors, which form the isotropic tetrad in Minkowski space

\[ b_\rho = (l_0 + \rho l_3)/2, \quad n_\lambda = (\lambda l_1 + i l_2)/2, \quad (\rho, \lambda = \pm 1). \]  

(2)

From Eqs. (1), (2) it follows that

\[ (b_\rho \cdot b_{-\lambda}) = \frac{\delta_{\lambda,\rho}}{2}, \quad (n_\lambda \cdot n_{-\rho}) = \frac{\delta_{\lambda,\rho}}{2}, \quad (b_\rho \cdot n_\lambda) = 0, \]  

(3)
\[ g^{\mu\nu} = 2 \sum_{\lambda=-1}^{1} \left[ b_{\lambda}^{\mu} \cdot b_{-\lambda}^{\nu} + n_{\lambda}^{\mu} \cdot n_{-\lambda}^{\nu} \right] . \] (4)

It is always possible to construct the basis of an isotropic tetrad (2) as numerical four-vectors

\[(b_{\pm 1})_{\mu} = (1/2) \{1, 0, 0, \pm 1\}, \quad (n_{\pm 1})_{\mu} = (1/2) \{0, \pm 1, i, 0\} \] (5)

or by means of physical vectors for reaction.

Also for practical applications it is convenient to introduce the tensor \( X^{\mu,\nu} \) which are related to isotropic tetrad vectors (3)

\[ X^{\mu,\nu}_{A, \lambda} = 4 \left( b_{A}^{\mu} \cdot n_{\lambda}^{\nu} - n_{\lambda}^{\mu} \cdot b_{A}^{\nu} \right) , \] (6)

and the contractions with arbitrary four-vectors

\[ X^{p,\nu}_{A, \lambda} \equiv p_{\mu} X^{\mu,\nu}_{A, \lambda} , \]
\[ X^{p, q}_{A, \lambda} \equiv p_{\mu} q_{\nu} X^{\mu,\nu}_{A, \lambda} = 4 \left( (p \cdot b_{A}) (q \cdot n_{\lambda}) - (p \cdot n_{\lambda}) (q \cdot b_{A}) \right) . \] (7)

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams”
If four-vectors $p = (p^0, p^x = p^0\sin\theta_p\sin\varphi_p, \ p^y = p^0\sin\theta_p\cos\varphi_p, \ p^z = p^0\cos\theta_p)$ and $q = (q^0, q^x = q^0\sin\theta_q\sin\varphi_q, \ q^y = q^0\sin\theta_q\cos\varphi_q, \ q^z = q^0\cos\theta_q)$ are lightlike, that the function $X_{A,\lambda}^{p,q}$ is connected with spinor product of these vectors

$$
\langle p \ q \rangle = 2\sqrt{p^0q^0} \times \\
\times \left[ e^{-i\phi_p} \cos \frac{\theta_p}{2} \sin \frac{\theta_q}{2} - e^{-i\phi_q} \cos \frac{\theta_q}{2} \sin \frac{\theta_p}{2} \right] \tag{8}
$$

by means of

$$
X_{1,1}^{p,q} = 2\sqrt{(p \cdot b_1) (q \cdot b_1)} \langle p \ q \rangle \tag{9}
$$

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams”
Polarization Vectors of Massless Bosons

By means of the isotropic tetrad vectors we can determine the polarization vectors of massless (also and massive) vector bosons. For photons with momentum $k^\mu$ and helicity $\lambda = \pm 1$ we use following definition of polarizations in the axial gauge

$$\varepsilon_\lambda (k) = -\sqrt{2} \lambda \left[ (k \cdot n_{-\lambda}) b_{-1} - (b_{-1} \cdot k) n_{-\lambda} \right] \overline{(k \cdot b_{-1})}$$

$$= -\lambda X_{-1,-\lambda}^{\mu,k} \overline{2\sqrt{2} (k \cdot b_{-1})}, \quad (10)$$

provided that, the four-vectors $k, b_1, b_{-1}$ are linearly independent.

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams”
Massless basis spinors

With the help of isotropic tetrad

\[ b_\rho = (l_0 + \rho l_3)/2, \quad n_\lambda = (\lambda l_1 + il_2)/2, \quad (\rho, \lambda = \pm 1). \]

we define basis spinors \( u_\lambda (b_{-1}) \) and \( u_\lambda (b_1) \)

**Definition**

\[ \gamma^-_1 u_\lambda (b_{-1}) = 0, \quad u_\lambda (b_1) \equiv \gamma_1 u_{-\lambda} (b_{-1}), \quad (11) \]

\[ \omega_\lambda u_\lambda (b_{\pm 1}) = u_\lambda (b_{\pm 1}) \quad (12) \]

with the matrix \( \omega_\lambda = 1/2 (1 + \lambda \gamma_5) \) and the normalization condition

\[ u_\lambda (b_{\pm 1}) \bar{u}_\lambda (b_{\pm 1}) = \omega_\lambda \gamma^-_{\pm 1}. \quad (13) \]

Victor Andreev, "Recursive technique for evaluation of Feynman diagrams"
Phase condition. The relative phase between basis spinors with different helicity is given by

\[ \phi_{\lambda} u_{-\nu} (b_{-1}) = \delta_{\lambda,\nu} u_{\lambda} (b_{-1}) . \]  
(14)

Some properties of basis spinors

The important property of basis spinors (11) is the completeness relation

\[ \sum_{\lambda,A=-1}^{1} u_{\lambda} (b_A) \bar{u}_{-\lambda} (b_{-A}) = I , \]  
(15)

which follows from Eqs.(11),(14). Thus, the arbitrary bispinor can be decomposed in terms of basis spinors \( u_{\lambda} (b_A) \).

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams ”
With the help of $g^{\mu\nu} = 2 \sum_{\lambda=-1}^{1} [b_{\lambda}^{\mu} \cdot b_{\lambda}^{\nu} + n_{\lambda}^{\mu} \cdot n_{\lambda}^{\nu}]$ Dirac matrix $\gamma^{\mu}$ can be rewritten as

$$\gamma^{\mu} = g_{\mu\nu} \gamma^{\nu} = 2 \sum_{\lambda=-1}^{1} \left[ b_{-\lambda} b_{\lambda}^{\mu} + \gamma_{-\lambda} n_{\lambda}^{\mu} \right]. \quad (16)$$

Using the Eqs.(14),(16) we can obtain that

$$\gamma^{\mu} u_{\lambda} (b_{A}) = 2 b_{A}^{\mu} u_{-\lambda} (b_{-A}) - 2 A n_{-A \times \lambda}^{\mu} u_{-\lambda} (b_{A}) , \quad (17)$$

$$\bar{u}_{\lambda} (b_{C}) u_{\rho} (b_{A}) = \delta_{\lambda,-\rho} \delta_{C,-A}, \ (C, A, \lambda, \rho) = \pm 1 , \quad (18)$$

$$\omega_{\lambda} u_{\rho} (b_{A}) = \delta_{\lambda,\rho} u_{\rho} (b_{A}) . \quad (19)$$

and

$$\gamma^{\mu} \gamma^{\nu} u_{\lambda} (b_{A}) = g^{\mu\nu} u_{\lambda} (b_{A}) - A X_{A,-A \times \lambda}^{\mu,\nu} u_{\lambda} (b_{-A}) . \quad (20)$$

Eqs.(17)-(19), and also Eq. (20) underlie the our method .

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams ”
Recursion relations for matrix element

When evaluating a Feynman amplitude involving the fermions, the amplitude is expressed as sum of terms which have the form

\[ \mathcal{M}_{\lambda_p, \lambda_k}(p, s_p, k, s_k; Q) = \]

\[ = \mathcal{M}_{\lambda_p, \lambda_k}([p], [k]; Q) = \bar{u}_{\lambda_p}(p, s_p) Q u_{\lambda_k}(k, s_k), \quad (21) \]

where \( \lambda_p \) and \( \lambda_k \) are the polarizations of the external particles with four-momentum \( p, k \) and arbitrary polarization vectors \( s_p, s_k \). The operator \( Q \) is a sum of products of Dirac \( \gamma \)-matrices. The matrix element (21) with Dirac spinors is a scalar function. As such, it should be expressible in terms of scalar functions formed from the spin and momentum four-vectors of the Dirac spinors, including \( p, s_p, k, s_k \) and of the operator \( Q \). We will now that in the our approach this matrix element (21) can be represented as linear combinations of the products of the lower-order matrix element.
Basic matrix element

Let us consider a special case of a matrix element (21), when $p = b_{-C}$ and $k = b_{A}$, i.e.

$$M_{-\sigma,\rho} (b_{-C}, b_{A} ; Q) \equiv \equiv \Gamma_{\sigma,\rho}^{C,A} [Q] \equiv \bar{u}_{-\sigma} (b_{-C}) Q u_{\rho} (b_{A}) .$$  \hspace{1cm} (22)

With the help of the completeness relation (15) we can obtain the recursion formula for $\Gamma_{\sigma,\rho}^{C,A} [Q_{1}Q_{2}]$

$$\Gamma_{\sigma,\rho}^{C,A} [Q_{1}Q_{2}] = \sum_{D,\lambda=-1}^{1} \Gamma_{\sigma,\lambda}^{C,D} [Q_{1}] \Gamma_{\lambda,\rho}^{D,A} [Q_{2}] .$$  \hspace{1cm} (23)

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams ”
By means of relations

\[\gamma^\mu u_\lambda (b_A) = 2 b_A^\mu u_{-\lambda} (b_{-A}) - 2 A n_{-A \times \lambda}^\mu u_{-\lambda} (b_A),\]  
(24)

\[\bar{u}_\lambda (b_C) u_\rho (b_A) = \delta_{\lambda,-\rho} \delta_{C,-A}, (C, A, \lambda, \rho) = \pm 1,\]  
(25)

it is easy to calculate \(\Gamma^{C,A}_{\sigma,\rho}\) in terms of the isotropic tetrad vectors. For instance,

\[\Gamma^{C,A}_{\sigma,\rho} [\gamma^\mu] =
\]
\[= 2\delta_{\sigma,-\rho} \left( \delta_{C,A} b_A^\mu - A \delta_{C,A} n_{-A \times \rho}^\mu \right),\]  
(26)

\[\Gamma^{C,A}_{\sigma,\rho} [\gamma^\mu \gamma^\nu] =
\]
\[= \delta_{\sigma,\rho} \left( \delta_{C,A} g_{\mu \nu} - A \delta_{C,-A} X_{A, -A \times \rho}^{\mu, \nu} \right),\]  
(27)

where \(X_{A, -A \times \rho}^{\mu, \nu}\) is determined by Eq.(7).
Decomposition coefficients

The next type of lower-order matrix element (21) is

\[ \mathcal{M}_{\rho,\lambda_p} (b_A , [p] ; I) \equiv \mathcal{M}_{\rho,\lambda_p} (b_A , [p]) = \]

\[ = \bar{u}_\rho (b_A) u_{\lambda_p} (p, s_p) . \]  

(28)

The matrix element (28) is determined the decomposition coefficient of an arbitrary Dirac spinor on basis spinors (11).

The opportunity of calculating the coefficients (28) is founded on that an arbitrary Dirac spinor can be determined through the basis spinor (11) with the help of projection operators.

Let us consider massive fermions. The Dirac spinors for massive fermion and antifermion with four-momentum \( p \) and arbitrary polarization vector

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams ”
$s_p$ can be obtained with the help of the relation

$$w^A_\lambda (p, s_p) = \frac{(\not p + Am_p) (1 + \lambda_p \gamma_5 \not s_p)}{2 \sqrt{(b_{-1} \cdot (p + m_p s_p))}} u_{-A \times \lambda_p} (b_{-1}) .$$  \hspace{1cm} (29)

The notation $w^A_\lambda (p, s_p)$ stands for either $u_{\lambda_p} (p, s_p)$ (Dirac spinor of fermion; $A = +1$) or $\upsilon_{\lambda_p} (p, s_p)$ (Dirac spinor of antifermion; $A = -1$). The bispinors $u_{\lambda} (p, s_p)$ and $\upsilon_{\lambda} (p, s_p)$ satisfy Dirac equation and spin conditions for massive fermions and antifermions.

We also found, that the Dirac spinors of fermions and antifermions are related by

$$\upsilon_{\lambda} (p, s_p) = -\lambda \gamma_5 u_{-\lambda} (p, s_p) ; \quad \bar{\upsilon}_{\lambda} (p, s_p) = \bar{u}_{-\lambda} (p, s_p) \lambda \gamma_5 .$$  \hspace{1cm} (30)

The Dirac spinor $u_{\lambda} (p)$ of massless fermion with momentum $p$ ($p^2 = 0$, $(p \cdot b_{-1}) \neq 0$) and helicity $\lambda$ is defined by (see, for example, R. Kleiss, W.J. Stirling, Nucl. Phys. B262, 235 (1985); Victor Andreev, “Recursive technique for evaluation of Feynman diagrams ”)
\[ u_\lambda(p) = \frac{p}{\sqrt{2(p \cdot b_{-1})}} u_{-\lambda}(b_{-1}). \] (31)

With help of the Eqs.(29),(31) the matrix element (28) transform to

\[ \mathcal{M}_{\rho,\lambda_p}(b_A, [p]) = \]

\[ = \frac{\bar{u}_\rho(b_A) \left[ g_p^p + g_{p-1}^p \xi_{1}^p/m_p \right]}{\sqrt{2(b_{-1} \cdot \xi_{1}^p)}} \bar{u}_{-\lambda_p}(b_{-1}) \] (32)

for the massive fermions with arbitrary vector of polarization and transform to

\[ \mathcal{M}_{\rho,\lambda_p}(b_A, p) = \frac{\bar{u}_\rho(b_A) \cdot p \cdot u_{\lambda_p}(b_{-1})}{\sqrt{2(b_{-1} \cdot p)}} \] (33)

for massless fermions. Here we have introduced the abbreviations

\[ \xi_{\pm 1}^p = \frac{p \pm m_p s_p}{2}. \] (34)

Hence the matrix element (28) transform to “fermion string” with massless
basis spinors \( u_\lambda (b_A) \).

Using the Eqs.(17)-(19) and (20) the matrix element (28) is reduced to an algebraic expression in terms of scalar products of isotropic tetrad vectors and physical vectors or in terms of components of four-vectors.

Let us consider massless fermions. Using Eqs.(17)-(18) we obtain, that

\[
\mathcal{M}_{\rho,\lambda} (b_A, p) = \delta_{\lambda,-\rho} \sqrt{2} \left[ \delta_{A,-1} \sqrt{p \cdot b_{-1}} - \delta_{A,1} \frac{(p \cdot n_{-\lambda})}{ \sqrt{(p \cdot b_{-1})}} \right]. \tag{35}
\]

For numerical calculations, as well as in the case of spinor techniques, it is convenient to determine the (35) through the momentum components

\[
p = (p^0, \ p^x = p^0 \sin \theta_p \sin \varphi_p, \ p^y = p^0 \sin \theta_p \cos \varphi_p, \ p^z = p^0 \cos \theta_p)
\]

\[
\mathcal{M}_{\rho,\lambda} (b_A, p) = \delta_{\lambda,-\rho} \left[ \delta_{A,-1} \sqrt{p^+} - \delta_{A,1} \lambda \exp (i \lambda \varphi_p) \sqrt{p^-} \right]
\]

\[
= \delta_{\lambda,-\rho} \sqrt{2p_0} \left[ \delta_{A,-1} \cos \frac{\theta_p}{2} - \delta_{A,1} \lambda \sin \frac{\theta_p}{2} \exp (i \lambda \varphi_p) \right], \tag{36}
\]

**Victor Andreev**, “Recursive technique for evaluation of Feynman diagrams”
where
\[ p^\pm = p^0 \pm p^z, \quad p^x + i\lambda p^y = \sqrt{(p^x)^2 + (p^y)^2} \exp(i\lambda \varphi_p). \]

Let us consider massive Dirac massive particles with arbitrary polarization vector \( s_p \). After evaluations we obtain, that the decomposition coefficients for a massive fermion with momentum \( p \), an arbitrary polarization vector \( s_p \) and mass \( m_p \) can be written as scalar products of tetrad and physical vectors

\[
M_{\rho, \lambda_p} (b_A, p, s_p) = \frac{1}{\sqrt{2} (b_{-1} \cdot \xi_1^p)} \\
\left[ 2\delta_{\lambda, -\rho} \left\{ \delta_{A, -1} (b_{-1} \cdot \xi_1^p) + \delta_{A, 1} (n_{-\lambda_p} \cdot \xi_1^p) \right\} + \\
+\delta_{\lambda, \rho} \left\{ \delta_{A, 1} \frac{m_p}{2} + \delta_{A, -1} \frac{X^{\xi_{-1}^p, \xi_1^p}}{m_p} \right\} \right], \tag{37}
\]

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams”
where $X^{p,q}$ is determined by Eq.(7).

If the polarization vector $s_p$ of fermion is defined as follows (so called $BDKS$ polarization states)

$$s_p \equiv s_{KS} = \frac{p}{m_p} - m_p \frac{b_{-1}}{(p \cdot b_{-1})}, \quad (38)$$

that the matrix element (37) have a compact form

$$M_{\rho,\lambda}(b_A, p, s_{KS}) = \sqrt{2} \delta_{\lambda,-\rho} \left[ \delta_{A,-1} \sqrt{(p \cdot b_{-1})} + \delta_{A,1} \frac{(p \cdot n_{\lambda})}{\sqrt{(p \cdot b_{-1})}} \right] +$$

$$+ \delta_{\lambda,\rho} \delta_{A,1} \frac{m_p}{\sqrt{2(p \cdot b_{-1})}}, \quad (39)$$

**Victor Andreev, “Recursive technique for evaluation of Feynman diagrams”**
The matrix element (28) with the antifermion can be easily obtained with the help of Eq.(30):

\[
\hat{M}_{\rho,\lambda_i} (b_A , [p]) = \bar{u}_\rho (b_A) v_{\lambda_i} (p, s_p) = \\
= \rho \lambda_i M_{\rho,\lambda_i} (b_A, [p]) .
\] (40)
Recursion relation

With the help of completeness relation (15) the amplitude (21) with
$Q = Q_2 Q_1$ is expressed as combinations of the lower-order matrix element

$$M_{\lambda p, \lambda k} ([p], [k]; Q_2 Q_1) =$$

$$= \sum_{\sigma, A = -1}^1 M_{\lambda p, \sigma} ([p], b_A; Q_2) M_{-\sigma, \lambda k} (b_{-A}, [k]; Q_1) .$$

(41)

This insertion allows us to “cut” fermion chain (21) into pieces of fermion
chains with basis spinors $u_\lambda (b_A)$ (see Fig.2)
Figure 2: Diagram for the recursion relation (41)

Hence the our formalism enables to calculate the blocks of the Feynman diagrams and then to use them in the calculation as scalar functions. All possible Feynman amplitudes can be built up from a set of “building” blocks.

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams ”
Let us consider the matrix element (21) with an operator
\[ Z^{(n)} = Q_n Q_{n-1} \cdots Q_1 Q_0 \] (42)
with \( Q_0 = I \). In the Eq.(42) all operators \( Q_j \) have an identical mathematical expressions. Using Eq.(41) we find that
\[
\mathcal{M}_{\lambda_p,\lambda_k} ([p], [k]; Z^{(n)}) \equiv \mathcal{M}_{\lambda_p,\lambda_k}^{(n)} ([p], [k]) = \\
= \sum_{\sigma,A = -1} 1 \mathcal{M}_{\lambda_p,\sigma} ([p], b_A) \mathcal{M}_{-\sigma,\lambda_k}^{(n)} (b_A, [k]) , \] (43)
where matrix element \( \mathcal{M}_{-\sigma,\lambda_k}^{(n)} (b_A, [k]) \) can be calculated with the help of recursion relation
\[
\mathcal{M}_{-\sigma,\lambda_k}^{(n)} (b_A, [k]) = \\
= \sum_{\rho,C = -1} 1 \Gamma_{\sigma,\rho}^{A,C} [Q_n] \mathcal{M}_{-\rho,\lambda_k}^{(n-1)} (b_C, [k]) . \] (44)

**Victor Andreev**, “Recursive technique for evaluation of Feynman diagrams”
Examples

"Toy" example

$$
\mathcal{M}_{\lambda_p, \lambda_k}^{(n)} (p, s_p, k, s_k) = \\
= \bar{u}_{\lambda_p} (p, s_p) \phi_n \phi_{n-1} \cdots \phi_1 u_{\lambda_k} (k, s_k),
$$

where $q_j$ are some arbitrary four-vectors.

Therefore, we have that

$$
Z^{(n)} = \phi_n \phi_{n-1} \cdots \phi_1.
$$

With the help of Eqs. (43) and (44) we can obtain the recursion formulas

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams”
for calculation matrix element (45):

\[
\mathcal{M}_{\lambda_p, \lambda_k}^{(j)} ([p], [k]) =
\]

\[
= 2 \sum_{\rho, C = -1}^{1} \mathcal{M}_{\lambda_p, \rho} ([p], b_C) \left[ (q_j \cdot b_{-C}) \mathcal{M}_{\rho, \lambda_k}^{(j-1)} (b_C, [k]) - 
\right.
\]

\[
- C \left( q_j \cdot n_{C \times \rho} \right) \mathcal{M}_{\rho, \lambda_k}^{(j-1)} (b_{-C}, [k]) \right],
\]

and

\[
\mathcal{M}_{\lambda_p, \lambda_k}^{(j)} ([p], [k]) =
\]

\[
= \sum_{\rho, C = -1}^{1} \mathcal{M}_{\lambda_p, \rho} ([p], b_C) \left[ (q_j \cdot q_{j-1}) \mathcal{M}_{-\rho, \lambda_k}^{(j-2)} (b_{-C}, [k]) + 
\right.
\]

\[
+ C X^{q_j, q_{j-1}}_{-C, C \times \rho} \mathcal{M}_{-\rho, \lambda_k}^{(j-2)} (b_C, [k]) \right].
\]
Photon emission

Let us consider the matrix element where photon emission occurs from the incoming electron

\[ \mathcal{M}_{\lambda_2,\lambda_1} ([p_2], [p_1]; Q, Z_k) = \bar{u}_{\lambda_2} (p_2, s_{p_2}) Q Z_k u_{\lambda_1} (p_1, s_{p_1}), \text{ where (49)} \]

\[ Z_k = \frac{(p_1 - k + m_e)  \not\varepsilon \sigma (k)}{(p_1 - k)^2 - m_e^2}. \tag{50} \]

Using the algebra of \(\gamma\)-matrix and Dirac equation the operator \(Z_k\) rewritten as

\[ Z_k = \frac{(p_1  \varepsilon \sigma (k))}{(p_1 k)} - \frac{k  \not\varepsilon \sigma (k)}{2 (p_1 k)}. \tag{51} \]

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams”
Now we get

\[
\mathcal{M}_{\lambda_2, \lambda_1} ([p_2], [p_1]; Q, Z_k) = \frac{(p_1 \varepsilon \sigma (k))}{(p_1 k)} \mathcal{M}_{\lambda_2, \lambda_1} ([p_2], [p_1]; Q) - \frac{1}{2 (p_1 k)} \mathcal{M}_{\lambda_2, \lambda_1} ([p_2], [p_1]; Q \not\varepsilon \sigma (k)) .
\]

(52)

The recursion technique (see Eq.(41)) imply

\[
\mathcal{M}_{\lambda_2, \lambda_1} ([p_2], [p_1]; Q \not\varepsilon \sigma (k)) =
\]

\[
= \sum_{\sigma, C = -1} 1 \mathcal{M}_{\lambda_2, \sigma} ([p_2], b_C; Q) \mathcal{M}_{-\sigma, \lambda_1} (b_C, [p_1]; Q \not\varepsilon \sigma (k))
\]

\[
= \sum_{\sigma, C = -1} 1 \mathcal{M}_{\lambda_2, \sigma} ([p_2], b_C; Q) \mathcal{M}_{-\sigma, \lambda_1} (b_C, [p_1]) C X_{k, \varepsilon \sigma (k)}^{k, \varepsilon \sigma (k)} .
\]

(53)

By means of the Eqs.(7),(10) we have that

\[
C X_{k, \varepsilon \sigma (k)}^{k, \varepsilon \sigma (k)} = \sqrt{2} (-C) \sigma (k; b_C) e^{-i (1 - C) \varphi_k}
\]

(54)

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams”
For the matrix element (49) with the fermions and photon of arbitrary polarization we have the exact formula in terms of lower-order matrix elements $M_{\lambda_2,\sigma}([p_2], b_C; Q)$ and $M_{-\sigma,\lambda_1}(b_C, [p_1])$

$$M_{\lambda_2,\lambda_1}([p_2], [p_1]; Q \not\parallel k \not\perp (k)) =$$

$$= \frac{(p_1 \epsilon_\sigma(k))}{(p_1 k)} M_{\lambda_2,\lambda_1}([p_2], [p_1]; Q) + \frac{1}{\sqrt{2} (p_1 k)} \times$$

$$\times \sum_{\sigma,C=-1} 1 M_{\lambda_2,\sigma}([p_2], b_C; Q)$$

$$\left\{ M_{-\sigma,\lambda_1}(b_C, [p_1]) C \sigma (k b_C) e^{-i(1-C)\varphi_k} \right\}, \quad (55)$$

where $M_{-\sigma,\lambda_1}(b_C, [p_1])$ is determined by the Eq.(37) for arbitrary fermion polarization or Eqs.(36), (39) for special cases of fermion polarization.
The process $e^+e^- \rightarrow n\gamma$

Consider the process

$$e^+ (p_2, \sigma_2) + e^- (p_1, \sigma_1) \rightarrow \gamma (k_1, \lambda_1) + \gamma (k_2, \lambda_2) + \cdots + \gamma (k_n, \lambda_n), \quad (56)$$

where the momenta of the particles and spin numbers are given between parentheses.

The Feynman diagrams of the processes (56) contain the matrix element

$$M^{(\lambda_1, \lambda_2, \ldots, \lambda_n)}_{\sigma_2, \sigma_1} (p_2, s_{p_2}; p_1, s_{p_1}; k_1, k_2, \ldots, k_n) =$$

$$= M^{(n)}_{\sigma_2, \sigma_1} ([p_2], [p_1]) = \bar{\nu}_{\sigma_2} (p_2, s_{p_2}) \not\lambda_n (k_n) \cdots$$

$$\cdots \not\lambda_3 (k_3) \frac{Q_2 + m}{Q_2^2 - m^2} \not\lambda_2 (k_2) \frac{Q_1 + m}{Q_1^2 - m^2} \not\lambda_1 (k_1) u_{\sigma_1} (p_1, s_{p_1}) +$$

$$+ (n! - 1) \text{ other permutations of } (1, 2, \ldots, n), \quad (57)$$

Victor Andreev, "Recursive technique for evaluation of Feynman diagrams"
where \( Q_j = p_1 - \sum_{i=1}^{j} k_i \). Hence, we have that

\[
\mathcal{M}_{\sigma_2,\sigma_1}^{(n)} ([p_2], [p_1]) = \sum_{\rho, C = -1}^{1} \tilde{\mathcal{M}}_{\sigma_2,\rho} ([p_2], b_C; \not\! \lambda_n (k_n)) \mathcal{M}_{-\rho,\sigma_1}^{(n-1)} (b_C, [p_1])
\]  

(58)

with

\[
\tilde{\mathcal{M}}_{\sigma_2,\rho} ([p_2], b_C; \not\! \lambda_n (k_n)) = \overline{\nu}_{\sigma_2} (p_2, s_{p_2}) \not\! \lambda_n (k_n) u_{\rho} (b_C) .
\]  

(59)

Using the expressions (27) and (10) we obtain, that (59) is determined by

\[
\tilde{\mathcal{M}}_{\sigma_2,\rho} ([p_2], b_C; \not\! \lambda_n (k_n)) =
\]

\[
= -\sqrt{2} \rho \sigma_2 \left[ \delta_{C,1} \cot \frac{\theta_n}{2} e^{i\lambda_n \varphi_n} \mathcal{M}_{-\sigma_2,-\rho} ([p_2], b_{-1}) + 
\right.
\]

\[
+ \rho \delta_{C,-\rho \times \lambda_n} \mathcal{M}_{-\sigma_2,-\rho} ([p_2], b_{-\rho \times \lambda_n})
\]  

(60)

for the \( k_n = k^0 (1, \sin \theta_n \cos \varphi_n, \sin \theta_n \sin \varphi_n, \cos \theta_n) \).

The final recursion relation of the process (56) with arbitrary polarization

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams”
states of the photons and fermions is written as

\[ \mathcal{M}_{\sigma_2,\sigma_1}^{(n)} ([p_2], [p_1]) = \sum_{\rho=-1}^{1} -\sqrt{2} \rho \sigma_2 \times \]

\[ \cot \frac{\theta_n}{2} e^{i \lambda_n \varphi_n} \mathcal{M}_{-\sigma_2,-\rho} ([p_2], b_{-1}) \mathcal{M}_{-\rho,\sigma_1}^{(n-1)} (b_{-1}, [p_1]) + \]

\[ + \rho \mathcal{M}_{-\sigma_2,-\rho} ([p_2], b_{-\rho \times \lambda_n}) \mathcal{M}_{-\rho,\sigma_1}^{(n-1)} (b_{\rho \times \lambda_n}, [p_1]) \] ,

(61)

where (see Eq.(47) and Eq.(48))

\[ \mathcal{M}_{-\rho,\sigma_1}^{(j)} (b_{-C}, [k]) = \frac{1}{Q_j^2 - m^2} \{ \]

\[ 2m [ (\varepsilon_j \cdot b_{-C}) \mathcal{M}_{\rho,\sigma_1}^{(j-1)} (b_{C}, [k]) - C (\varepsilon_j \cdot n_{C\rho}) \mathcal{M}_{\rho,\sigma_1}^{(j-1)} (b_{-C}, [k]) ] + \]

\[ + (Q_j \cdot \varepsilon_j) \mathcal{M}_{-\rho,\sigma_1}^{(j-1)} (b_{-C}, [k]) + C X_{C,C \times \rho}^{Q_j,\varepsilon_j} \mathcal{M}_{-\rho,\sigma_1}^{(j-1)} (b_{C}, [k]) \} , \]

(62)

with \( \varepsilon_j = \varepsilon_{\lambda_j} (k_j) \) and the scalar function \( X_{A,\rho}^{p,q} \).

Victor Andreev, “Recursive technique for evaluation of Feynman diagrams”
**Summary**

In present paper we have formulated a new effective method to calculate the Feynman amplitudes for various processes with fermions of arbitrary polarizations. In our method it is much easier to keep track of partial results and to set up recursive schemes of evaluation which compute and store for later use subdiagrams of increasing size and complexity. In our approach of the matrix element calculation:

1. We don’t use an explicit form of bispinors and $\gamma$-matrices

2. We don’t use or operation of trace calculations

3. In this method as well as in the trace methods the matrix element of Feynman amplitudes is reduced to the combination of scalar products of momenta and polarization vectors.

4. Unlike spinor technique in different variants

   **(F.A. Berends, P.H. Davervedt, and R. Kleiss, Nucl. Phys.**)

this method doesn’t use either Chisholm identities, or the presentation of the contraction $\not{p}$ with four vector $p$ and of the polarization vector of bosons through the bispinors.

in this method doesn’t use special Feynman rules for calculating of the matrix elements.

The recursive algorithms can be easily realized in the various systems of symbolic calculation (Mathematica, Maple, Reduce, Form) and in such packages as FeynArts
